

ADBLUE ADDITIVE

cod. HP450

Congratulations! You have just chosen a superior quality product. AdBlue is a 32.5% aqueous solution of urea that can cause salt deposits. The high purity and odorless additive HP450 is indispensable for the latest generation engines as it avoids the formation of such deposits and encrustations on the pump and on the injector, improving the jet (for optimal vaporization), and therefore avoiding the breaking.

USE: Continuously used in the liquid, with a ratio of 1% AdBlue (100 ml of product treats 10 liters of AdBlue), avoids the formation of scales on the injector placed in the system exhaust, favoring its functionality and duration.

- Prevents clogging of AdBlue injectors and pump.
- Keeps the injector clean and efficient while also reducing AdBlue consumption.
- Improve the reliability and efficiency of urea AdBlue (SCR) systems.
- Prevents the formation of crystals and salts.
- Keeps the SCR catalyst always clean.
- Dosage: 100 ml per 10 lt of AdBlue (preferably before filling the relative tank).
